

Keyscan

John F. Dyall
President – Keyscan Inc.

Keyscan is a product design developer manufacturer of security access control equipment. We manufacture the electronic hardware for all the systems and also we develop software.

What most end users see is the cards and the readers, but behind the cards and the readers for every system our control equipment and the software, that's where we excel.

Keyscan has 22 years of experience; we have developed over 50,000 systems through out Canada, United State and Latin America, and there is been a myriad of applications that we've use from anywhere from a single door office facility to a multinational corporation with hundreds of facilities across the world.

Keyscan started operation in 1990. We moved to the Whitby area in 2006 due to our aggressive growth during that time. We now have over 70 employees, 63 of which are situated in this facility.

During our search for a new building we explored various areas, but what really surprised us was the hospitality shown and demonstrated by the Town of Whitby. The people really want to great lengths to show us different facilities they where available in different areas and we finally decided to choose this facility and that was based upon the size of the building that was already here, obviously we have do extensive renovation to this particular facility, but we looked at it and it had a great access to the 401. Also a great parking, land and a lot of green spaces, so it made if very nice to build our organization here and the quality of life, living so close to where you work has been great for not only myself but also to our employees.

The less than 10 minute commute to most of us, really reflects a great way to raise your children and you know, some of us have the opportunity to go home for lunch. If you live in Whitby, why not work here?

Again a great opportunity being so close to the 401 and having all the necessarily logistic companies close by. So we have no problems whatsoever in exporting our products throughout the United States, throughout Latin America and also domestically in the Canadian market.
